

# Regular Acquisition Functions

- Aim to find the maximum in a single step
- Do not capture the value of the information gained from sampling a solution
- **Where is the maximum of our function?**

# Knowledge Gradient

- Sampling at a point provides some information to later time steps
- Simulates a one step lookahead from our sampling point
- **If I sample next at point  $x$  what's the expected increase in my best predicted value after updating the GP?**

# Formal Definition

$$\text{KG}(x) = \mathbb{E} \left[ \max_{x'' \in \mathcal{X}} \{ \mu_y^{n+1}(x'') \} - \max_{x' \in \mathcal{X}} \{ \mu_y^n(x') \} \mid x^{n+1} = x \right] .$$
